

FentoC1aw

The Industrial Agent Runtime

Rust-native. Deterministic. Production-grade.

Direct execution of probabilistic models violates enterprise safety.

Connecting raw inference systems directly to production infrastructure introduces unmanageable risks to uptime, security, and compliance.

Defining a new infrastructure class: The Runtime Authority.

FemtoClaw is not a framework. FemtoClaw is not an orchestration wrapper. It is an **execution authority**.

Separating inference from execution authority

Anatomy of the Industrial Runtime.

Six deterministic subsystems operating in unison to guarantee system correctness.

The Execution Safety Model.

Memory-Safe Runtime
Powered by Rust to eliminate memory vulnerabilities.

Protocol Validation
Enforcing strict structured outputs before routing.

Capability-Gating
Limiting actions based on granular permissions.

Explicit Boundaries
FemtoClaw executes actions.
Inference systems only suggest them.

Production-grade performance characteristics.

Startup Time

~2–10 ms

Memory Footprint

~1–10 MB

Binary Size

~2–5 MB

Execution Overhead

Microseconds per step

Optimized for Enterprise Infrastructure, CI/CD automation, and Air-gapped edge environments.

Invariant core. Infinite extensibility.

Zero dependencies. Deploy anywhere Rust runs.

Single binary deployment. Completely decoupled from host application runtimes.

Verifiable correctness & enterprise compliance.

Runtime conformance validation

Safety guarantee verification

Determinism validation

Performance benchmarking

Powered by dedicated test harnesses:
femtoclaw-compliance
femtoclaw-bench

The FemtoClaw Open Source Ecosystem.

Deploy your first industrial runtime.

```
# Install FemtoClaw
cargo install femtoclaw

# Run a local, air-gapped agent
femtoclaw run --brain local

# Execute a deterministic action
femtoclaw once "summarize system status"_
```
